Informatics and Computer Science	**Coursework Brief Proofing & Printing Confirmation Sheet**	
Module Title	**Database I (Database Systems)**	Module Code **25CSIS03C**
Module Leader	**Dr. Doaa Elzanfaly**	Semester **One**
Proofed by	**Dr. Nermin Othman**	

I hereby confirm that:

- This coursework brief has been proof-read (spelling and grammar) *
- This coursework brief assesses the ILOs for the module *
- This coursework brief follows the approved template *
- All questions (and sub questions) have their marks specified *

Signed (Proof Reader): Nermin Othman

Signed (Module Leader) Doaa Elzanfaly

Instructions to Students:

This is a group project. Number of members per team must be 5 students. You are free to choose your own project members; if you would like the instructor to assign you to a group, say so in class.

1. Submission: The submission is via the *Turnitin system only* according to the Deliverables Schedule

2. Assessment: According to the attached marking schema, 40% of the project mark is allocated to the group work while 60% is for evaluating students individually. Not all the members of the group will get the same grade

3. Feedback: Feedback is to be given using the feedback form on the e-learning. For phase one, the feedback is to be given and documented during the discussion. Moreover, oral generic feedback to address common mistakes on project phases is to be given during teaching sessions.

4. Academic Honesty: You can only submit your own work. Any student suspected of plagiarism will be subject to the procedures set out in the GAR. You are not allowed to use any AI generative tool such as ChatGPT.

5. Project Specs:

The goal of the project is to develop a database system application that will enable you to apply the learnt concepts in the design and implementation of relational database systems concepts. The project includes the following activities spread over the entire semester:

- **Project Proposal**

  Due: Teaching Week 3

  Weight: Not graded

  In this phase you are required to do the following:

  - **Form a team and pick a topic**

  - A group of 5 students should do each project. You are free to choose your own project members; if you would like the module leader to assign you to a group, say so in class.
  - Choose, you and your team, an application of your interest to build a database for it.

  - **Write the project proposal**

    - The project proposal must contain the following:
      - The project title, student names, IDs, and e-mails
      - A brief description about your database (one paragraph)

    Notes:

    - The project proposal is not graded. The main objective of the project proposal is to mutually agree on the project that is feasible over one semester.
    - **Each group should submit the assignment through E-learning submission link and by only one member of the group.**

- **Phase One: Database Identification and Preliminary Design (Logical Design)**

  Due: Teaching Week 6

  Weight: 40%

  - A cover with the project title, student names, IDs, and e-mails
  - A detailed description about your database, its scope, and its functionalities.
  - The conceptual schema (EERD) for your database that Identifies entities, attributes, relationships, constraints, specialization/generalization constraints, etc.).
  - **Each group should submit the assignment through Turnitin submission link and by only one member of the group.**

- **Phase Two: Database Implementation & Final Report**

  Due: Teaching Week 11

  Weight: 50%

  - Map the conceptual model into an implementation model.
  - Normalize your schema
  - Implement the database.
  - Use SQL to access and manipulate data.

  The final report should include the whole documentation of your database along with the developed code.

  - **Each group should submit the REPORT through Turnitin System submission link while the whole project (Database + Report) should be submitted on E-Learning submission link and by only one member of the group.**

- **Present your project**

  Due: Teaching Week 12

  Weight: 10%

  At the end of the semester, each team is required to make a PowerPoint presentation to the class. Each presentation will be graded mainly based on three factors: (1) clarity of the slides and presentation; (2) the effectiveness of using time; (3) how well you answer questions.

6. Deliverable Schedule

Date	Deliverable	Marks
Week 7	Database Identification and Preliminary Design	40%
Week 12	Database Implementation & Final Report	50%
Week 13	Discussion	10%

Project Marking Schema

Database Identification and Preliminary Design (Group Work): 40% of the project mark

The marking of this phase will be based on a discussion where the students can explain their project and design ideas to the module leader / TAs. An instant feedback will be given to the students during the discussion and the team should nominate one of its members to document this feedback and check it with the TA.

Aspect	Score			Grade
	Full Mark (Well-defined)	**50% of the mark (Not well-defined)**	**0 mark (Not defined)**	
Creative Idea (5)	Out of the box ideas that is applicable for databases	Regular idea that is away from the lectures and the labs' examples.	Idea that resamples the lectures and the labs' examples	
Updated Proposal (5)	Fulfil all points that were given in the feedback with all necessary changes (if any).	Not fulfilling all the points that were given in the feedback with all necessary changes.	If not submitting the proposal in week 3.	
DB Scope (3)	The scope is well defined. The level of detail of the topic is clear and can be easily identified from the provided text.	The scope is vague such that the topic can be determined but is unclear. The topic can't be easily determined from the text.	The scope is messy and not clear such that the main idea can't be identified from the text.	

DB Functionality (3)	The purpose for creating the database is clearly stated. At least 3-4 functionalities must be identified.	The purpose for creating the database can't be clearly identified. Only 1-2 functionalities are identified.	The functionalities of the database are missing or are very vague and brief.	
Detailed Description (3)	The description is very clear and well understood. There are no English mistakes, and the text is relevant and includes the main functions.	No functions have been included in the description. The text provided is partially understood and has 2 – 4 grammatical mistakes.	The description is very messy and unorganized. There is no clear line of thought throughout the text. There are no functions included and more than 4 grammatical errors.	
Using right symbols (3)	The used symbols are all drawn correctly and are used correctly	The symbols are drawn correctly but may be incorrectly used. A maximum of 2 mistakes is allowed.	There are incorrect symbols, and they are incorrectly used. Overall, there are more than 2 mistakes.	
Entities (3)	Appropriate number of entities in the entire conceptual schema. The names are in singular form. The English is correct and well understood and correctly represents the needed concepts	2-3 missing entities. No more than 2 of the entity names are in plural form. Some of the entities are in-fact attributes (a maximum of 2).	More than 3 missing entities. The names are not logical and do not support the topic of the project.	
Attributes (3)	There should be an appropriate number of attributes per entity. Attributes should include those that are multivalued / composite / complex. Attributes should be nouns and in singular form.	Only simple attributes. They are not well understood and are in-correct English. Attributes are nouns but may include plurals.	No attributes are included, or they are vague and unclear or unrelated to the entity they are added to.	
PKs (3)	All the primary keys for all the entities have been included. They candidate keys have been identified if the entity is weak.	Half of the primary keys have been included.	No primary keys have been provided and no candidate keys have been provided in the case of weak entities.	

Relationships (Types) (4)	Correct relationships including generalization/specialization (if needed). The names need to be in verb form and singular. There are no repeated words used and they need to be logical with respect to the connected entities	The relationship names are in the form of nouns. There are no more than 2 missing relationships. There is a maximum of 1 loop in the ERD.	There are more than 2 missing relationships and there is more than 1 loop in the entire schema. The names are incorrect or irrelevant to the connected entities.	
Relationships (Cardinality) (4)	Need to show that this aspect has been taken into consideration and that all considerations are logical and add to the value of the schema.	Need to show that this aspect has been taken into consideration. Not all considerations are logical with respect to the schema.	Didn't consider any of the cardinality issues. Any considerations are logically incorrect	
Relationships (Participation) (4)	Need to show that this aspect has been taken into consideration and that all considerations are logical and add to the value of the schema.	Need to show that this aspect has been taken into consideration. Not all considerations are logical with respect to the schema.	Didn't consider any of the cardinality issues. Any considerations are logically incorrect	
English (2)	English is clear and well structured. The format is grammatically correct and meaningful.	Parts are clear while others are unclear. There are a few (3 – 6) grammatical errors.	The proposal can't be understood because of the poor language. There are many grammatical errors	
Report aesthetics (2)	The document exactly follows the guidelines that have been included in the module.	The document is missing 1-2 items from the guidelines that have been included in the module.	The document doesn't follow the guidelines at all or is missing more than 3 items from the provided guidelines for the module.	
Total out of 40				

Database mapping (individual) 20% of the project mark

Note: Each group member MUST write very clearly his/her contribution in the creation of the entities, attributes and relationships of the database. Marks will be deducted for messy, unclear or absent division of work.

Aspect	Score			Grade
	Full Mark (Well-defined)	**50% of the Mark (Not well-defined)**	**0 (Not defined)**	
Modified Design (3)	Fulfil all points that were given in the feedback with all necessary changes (if any).	Not fulfilling all the points that were given in the feedback with all necessary changes.	Not fulfilling any of the points that were given in the feedback.	
Entities (5)	All entities are present and correct.	Entities are mostly correct. Only 1 or 2 are missing.	Entities have several errors. More than 2 entities are absent.	
Attributes (5)	All attributes are present and correct, including primary and foreign keys, composite, multivalued and complex attributes.	All attributes are correct, but missing only a max of 3 attributes, or 1 incorrect mapping of complex/multivalued/composite attributes.	Several attributes are incorrect, missing more than 3 attributes, or incorrect mapping of most complex/multivalued/composite attributes.	

Relationships (10)	Relationships are complete and all correct. Arrows are very clear and arrowheads are pointing in the right direction.	Relationships are correct, missing max 2 relationships. Arrows are unclear or 1 or 2 arrowheads are pointing in the wrong direction. Missing 2 arrows at most.	Missing more than 2 relationships. Absent or unclear arrows and arrowheads.	
Bonus work (2)	Adding significant aspect to the code that were not covered in the Lab.	Adding any aspect to the code that were not covered in the Lab.	None
